

Physiology LEC 5

Nervous System

Nerve cells

Type of cells

1-Neuroglial cells : which are a helper nerve cells

2-Neurons:

Neuron is the building unit of Nervous system

IT consists from

1-Dendrite

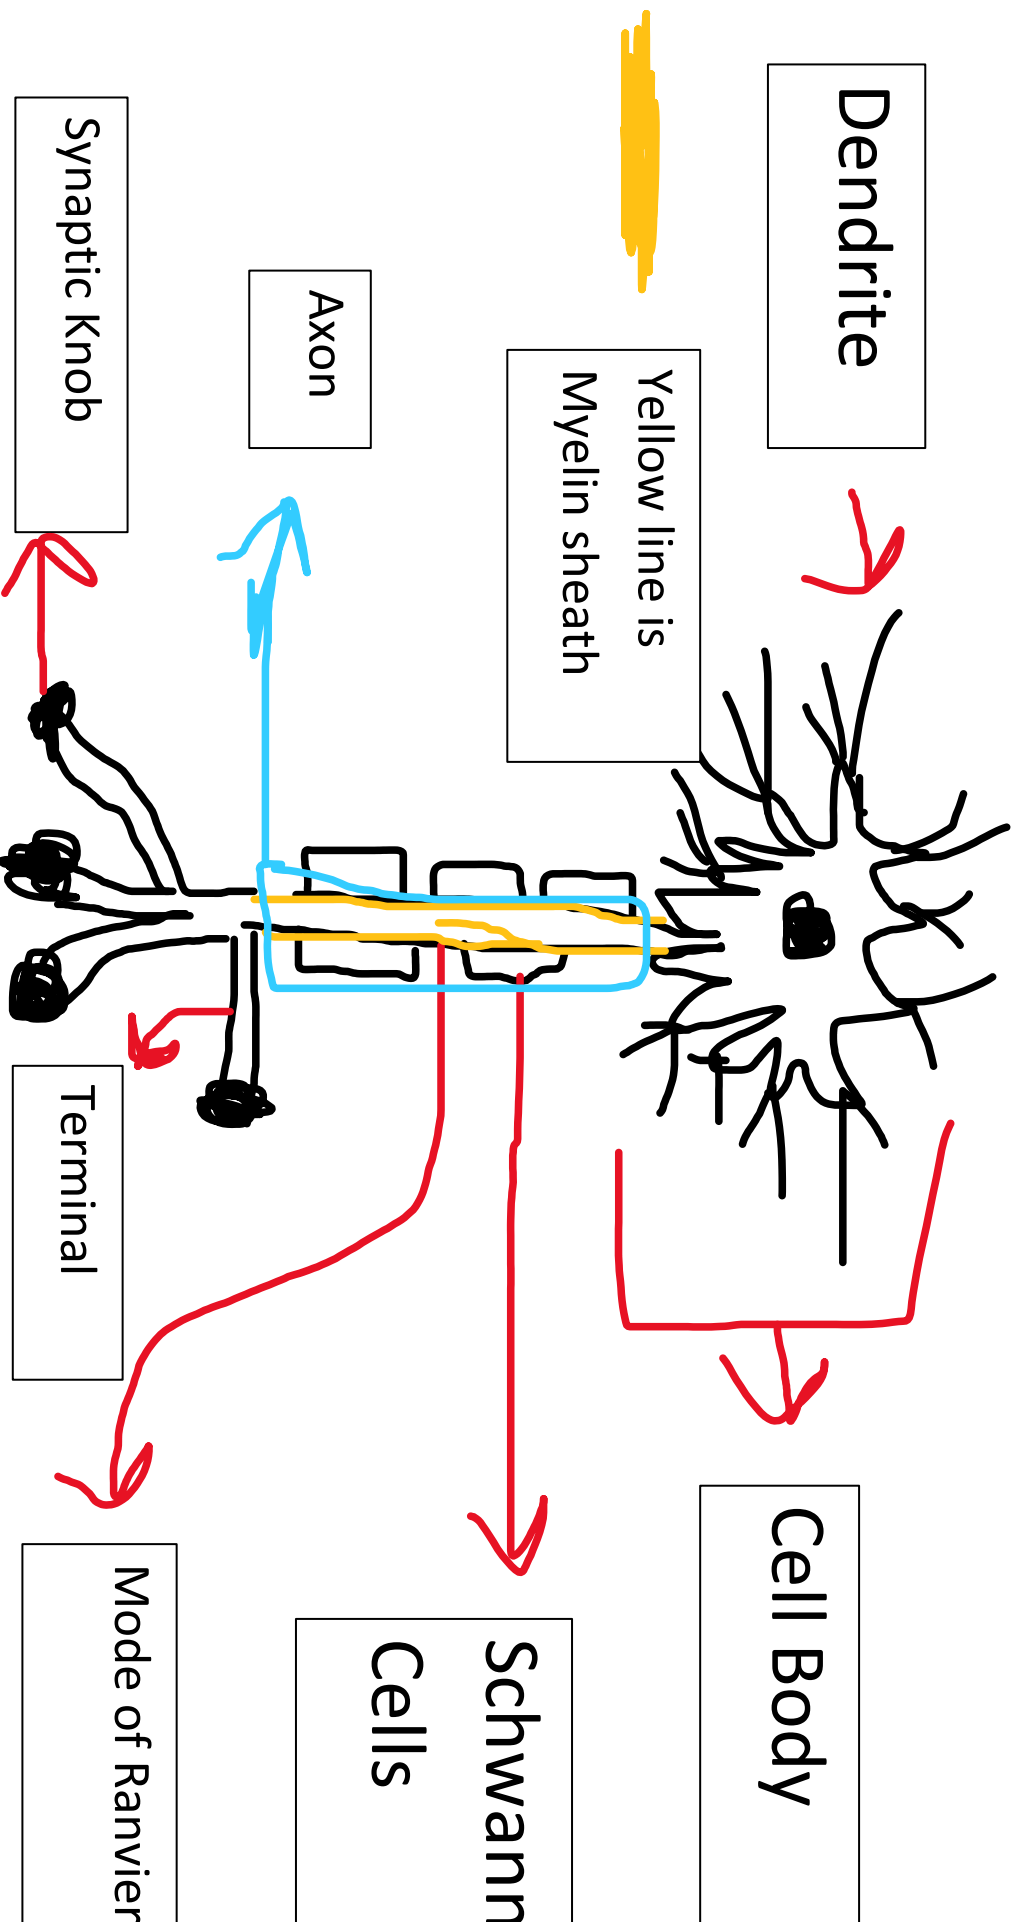

2-Cell body

3-Axon

4-Myelin sheath

5-Node of Ranvier

6-Synaptic Knobs

A-DENDRITE:

Receive signals from sensory organs

B-Cell Body:

Contain the cytoplasm and nucleus

C-AXON

- Single long process**
- Conduct nerve impulses away from cell body and toward the terminals**
- it may be myelinated or unmyelinated**
- Myelinated axon transmit signals faster than unmyelinated due to**

presence of gaps which are mode
of Ranvier this happen due to
presence of Schwann cell

D-MYELIN SHEATH

Cell membrane of glial cells wrap
around the axon

-Produced by

A-Schwann cells in nerves outside
brain and spinal cord

B-Oligodendrocytes in nerves in
brain and spinal cord
